A PYTHON PROGRAM TO IMPLEMENT KNN MODEL

Ex.No.: 9 A
Date of Submission: 18/10/2024

AIM:-

To implement a python program using a KNN Algorithm in a model.

ALGORITHM:-

Step1: Import all the other necessary libraries(numpy as np, matplotlib.pyplot as plt and sklearn.tree,pandas as pd and seaborn as sns).

Step2: Select the number K of the neighbors.

Step3: Calculate the Euclidean distance of K number of neighbors of data points.

Step4: Take the K nearest neighbors as per the calculated Euclidean distance.

Step5: Among these k neighbors, count the number of the data points in each category.

Step6: Assign the new data points to that category for which the number of the neighbor is maximum.

Step7: Plot the graph “X” and “y” the values tested and predicted using seaborn.scatterplot() function.

Step8: Print the confusion matrix of the model to know the accuracy of the model with support values for each class.

IMPLEMENTATION:-

```
import numpy as np
import matplotlib.pyplot as plt
import pandas as pd

dataset = pd.read_csv('../input/mall-customers/Mall_Customers.csv')
X = dataset.iloc[:,[3,4]].values
print(dataset)
```
